Keeping Kids Safe
KEEPING KIDS SAFE

A Guide for Safe Food Handling & Sanitation
For Child Care Providers
Today, more than ever, food safety and sanitation are emerging as important issues for child care providers.

Why?

- Children under 5 years old are especially susceptible to foodborne illnesses, which can cause serious side-effects, even death.
- Children in diapers present special sanitation and health problems. For instance, illness originally caused by foodborne bacteria can easily be spread by diapered children with diarrhea.

These issues are more crucial than ever before because more children are being cared for out of the home. Growth in the child care industry will continue to be dramatic. In 1970 only 30 percent of women with children under 5 were employed outside the home. By the year 2000, that number is expected to reach 75 percent.

How This Booklet Can Help

This booklet is designed to help people like you, by providing a quick and easy reference for food safety and sanitation.

Each page is designed to be copied and can be:

- Used as a handout in training,
- Included in a newsletter for staff or parents, or
- Posted on the wall as a daily reminder.

Because health and safety standards vary from state to state, it is crucial for child care providers to consult with their local Health Departments for local standards.

### RESOURCES
  page 18
HERE’S WHY HANDWASHING IS IMPORTANT.

Children in diapers present special health challenges for other children and as well as for child care providers. According to some studies:

- diarrhea is 30 percent more common in day care children than children cared for at home and, day care workers have higher rates of diarrheal illness.

WHEN TO WASH?

Key times for staff AND children include:

**IN THE BATHROOM**

- AFTER using the toilet
- AFTER changing diapers, (remember to wash the hands of the diapered child too!)
- AFTER helping a child at the toilet
- WHenever hands come in contact with body fluids, including vomit, saliva and runny noses

**IN THE KITCHEN**

- BEFORE fixing or eating food
- AFTER touching raw meat, poultry, fish or eggs
- AFTER meals and snacks

Handwashing is key. Diarrheal outbreaks could be cut in half by requiring staff to wash their hands—and the child’s hands—after changing diapers.
GERMS ON THE RUN!

While you and the children are washing hands, try this ditty:

Washing Hands Can Be Fun, Fun, Fun
Germs On The Run, Run, Run

Power ’em out—Pow
Power ’em out—Ka-zow!
Germs On The Run, Run, Run

Remember these handwashing instructions:
• use warm running water and soap
• wash for 10-20 seconds
• rinse
• dry with paper towel
DISINFECTING TIPS

When to “Disinfect” and when to “Sanitize?”

**Disinfect** refers to cleaning surfaces with the use of chemicals and virtually eliminating all germs. Diaper changing tables, for instance, always need to be disinfected. The Environmental Protection Agency regulates the use of disinfectants.

**Sanitize** is a less rigorous cleaning, designed to remove filth or soil and small amounts of certain bacteria. Surfaces that come in contact with food, like counters, are sanitized. Soap, detergent, or abrasive cleaners may be used to sanitize. The Food and Drug Administration regulates the use of sanitizer on food contact surfaces.

Whether you are using a commercial disinfectant or a sanitizer, always follow label directions carefully. Note where and how the product can be used.

Note: If you are mixing your own disinfecting solution, The National Health and Safety Performance Standards for Child Care recommend 1/4 cup bleach in 1 gallon water. Mix fresh daily. And never mix bleach with anything other than water. A poisonous gas can result.
SAFE DIAPERING

THREE KEYS TO KEEPING YOURSELF AND YOUR CHILDREN HEALTHY

- Use the diapering area ONLY for diapering. Never change diapers where you prepare or serve food.

- Changing tables should be cleaned and disinfected after each use. A variety of commercial disinfecting solutions are available. Directions on product labels should be followed closely.

- Always wash your hands and the child's hands—even if hands look clean.

Illness Alert—Bloody diarrhea in a child may be a symptom of a potentially deadly food poisoning caused by *Escherichia coli* O157:H7. Children who are not toilet-trained are especially likely to spread the infection. Family members and day care providers should pursue medical treatment for the child and consult their local health department for advice on preventing the spread of the infection.
SAFE HANDLING OF BOTTLES

CLEAN

• Wash bottles, bottle caps and nipples in the dishwasher OR hand wash, rinse and boil for 5 minutes or more just before re-filling.

REFRIGERATE

• Keep filled bottles of formula or breast milk in the refrigerator until just before feeding
• Refrigerate open containers of ready-to-feed or concentrated formula

WARMING

• Place bottles in hot (not boiling) water for 5 minutes
• Shake well and test milk temperature to make sure it’s not too hot before feeding

NEVER MICROWAVE BABY BOTTLES
Why? Microwaves heat unevenly. Resulting “hot spots” can scald baby's mouth and throat.

Baby Bottles: Most Important to Remember

• Use bottles only once, then clean thoroughly before using again.
• To avoid tooth decay, and ear infections, don’t put babies to bed with a bottle.

WHEN TO PITCH?

<table>
<thead>
<tr>
<th>Formula Type</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Leftover formula</td>
<td>Immediately</td>
</tr>
<tr>
<td>Why? Bacteria from the baby’s mouth contaminates the formula where it can grow and multiply.</td>
<td></td>
</tr>
<tr>
<td>Prepared bottle</td>
<td>After 24 hours</td>
</tr>
<tr>
<td>Open containers of ready-to-feed or concentrated formula</td>
<td>After 48 hours</td>
</tr>
<tr>
<td>Unused breast milk</td>
<td>After 48 hours</td>
</tr>
<tr>
<td>(May be frozen for 2 weeks)</td>
<td></td>
</tr>
</tbody>
</table>

Final note: Check “Use by” dates on formula. If it has passed, stay safe. Throw it out.
ADVICE FOR MOTHERS

Because babies are especially susceptible to bacteria, we want to help you—the parent—keep your baby safe.

Keep these guidelines in mind when preparing breast milk for your child to use while in our care.

Guidelines:

- Store breast milk in sterilized bottles
- Label each container with the name of the child, date and time milk was pumped
- Refrigerate promptly and use within two days, or
- Freeze and use within 2 weeks
SAFE HANDLING OF BABY FOOD

- Serve food to the baby from a dish—not from a jar or can—AND
- Throw away uneaten food from the dish

WHY?
The surface of the container hasn’t been cleaned and may contain harmful bacteria.

Also, bacteria from the baby’s mouth contaminates the food, where it can grow and multiply before being served again. Too many bacteria can make the baby sick.

Special Notes:

- Check “Use by” dates on baby foods. If the date has passed, throw it out.

- Check to see that the safety button in the lid is down. If the jar lid doesn’t “pop” when opened, or is not sealed completely, don’t use it.

- Don’t heat baby foods in jars in the microwave. The heat is uneven and can product “hot spots” that can scald baby’s mouth and throat.

STORAGE OF BABY FOOD—ADVICE FROM USDA

<table>
<thead>
<tr>
<th>Opened or Freshly Made</th>
<th>Refrigerator</th>
<th>Freezer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Strained fruits and vegetables</td>
<td>2-3 days</td>
<td>6-8 months</td>
</tr>
<tr>
<td>Strained meats and eggs</td>
<td>1 day</td>
<td>1-2 months</td>
</tr>
<tr>
<td>Meat/vegetable combination</td>
<td>1-2 days</td>
<td>1-2 months</td>
</tr>
</tbody>
</table>

WHY?
The surface of the container hasn’t been cleaned and may contain harmful bacteria.

Also, bacteria from the baby’s mouth contaminates the food, where it can grow and multiply before being served again. Too many bacteria can make the baby sick.
Here’s Why Food Safety Is Important.

Children under 5 are susceptible to foodborne illness because their immune systems aren’t fully developed. Because of this, illness can lead to serious complications, even death.

Some foods pose special risks. These foods include: raw or undercooked meat, poultry, fish or eggs, and unpasteurized milk.

BASIC SAFE FOOD HANDLING

Cook it! Thoroughly cook meat, poultry, fish or eggs.

Clean it! Don’t contaminate other foods with bacteria from juices in uncooked meat, poultry, fish or eggs.

Cool it! Refrigerate cooked leftovers promptly in small, shallow containers. Improper cooling is one of the most common causes of foodborne illness.

Remedies

Keep in mind these three keys to safe food handling:

- Cook it! Thoroughly cook meat, poultry, fish or eggs.
- Clean it! Don’t contaminate other foods with bacteria from juices in uncooked meat, poultry, fish or eggs.
- Cool it! Refrigerate cooked leftovers promptly in small, shallow containers. Improper cooling is one of the most common causes of foodborne illness.
Cooking food thoroughly is the single best protection you and your children have against foodborne illness.

Using a meat thermometer is the surest way of knowing food is thoroughly cooked. Check out USDA’s Cooking Temperature Chart.
Cooking Temperatures

NOTE: This cooking temperature chart is different from the one included in “Keeping Kids Safe” when originally published in 1996. The chart has been updated based on revised information in the Food Code, but the temperatures below provide an extra margin of safety because you are cooking for young children. A more cautious approach is recommended so that children are protected from food borne illness. They are more susceptible than the general population.

<table>
<thead>
<tr>
<th>Product</th>
<th>Fahrenheit*</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>

<td>165°F</td>
</tr>
<tr>
<td>Fin fish, Shrimp, Minced fish such as fish sticks, fish or seafood patties, seafood stuffing, Oysters, Clams, Mussels</td>
<td></td>
</tr>
<tr>
<td>All Foods Cooked in the Microwave</td>
<td>165°F, with continued stirring, then hold covered 2 minutes</td>
</tr>
</tbody>
</table>

*Use a meat thermometer to make sure that food has reached the proper internal temperature to be thoroughly cooked.
CLEAN IT!

- WASH hands and work surfaces, like counters BEFORE starting food preparations
- WASH hands, working surfaces and utensils AFTER touching raw meat or poultry. And if children have helped in meal preparation, make sure they wash their hands as well.

Why is this important? Raw meat, poultry and eggs can contain dangerous bacteria. To keep bacteria from spreading, it’s important to wash anything that comes in contact with these raw foods.

For instance, don’t chop salad vegetables on a cutting board where you’ve just trimmed raw meat or poultry. Clean the board thoroughly before using again.

A Helpful Hint: To prevent the spread of bacteria from raw foods, store them on the bottom shelf of your refrigerator or on a plate. This helps prevent juices from dripping on other foods, like fruits and vegetables.
Cooling Tips:

One of the most common causes of food-borne illness is improper cooling.

Cooked food needs to be cooled rapidly so dangerous bacteria don’t multiply.

Because of this, cooked food needs to go into the refrigerator while it’s still hot. It’s not safe to cool it on the counter.

Cooked food needs to be stored in shallow containers—less than 3 inches deep—to speed up cooling. And don’t cover the food until it’s cool.

(P.S. Double check to make sure that no juices from raw meat or poultry can drip onto uncovered, cooling foods.)

COOL IT!

How Low Will It Go?

How long would it take for the temperature to drop to a safe level if you were to refrigerate an 8 inches stock pot of steaming chicken soup?

24 Hours!!

To be safe, store hot food in shallow containers in layers less than: THREE INCHES deep
COLD STORAGE

*Also important:*
- Because bacteria multiply rapidly at room temperature, remember to promptly refrigerate perishable groceries.

**And,**
- Never thaw food on the counter. Thaw in the refrigerator, under cold running water, or in the microwave. (Plan to cook right away, should you thaw in the microwave.)

- • Because bacteria multiply rapidly at room temperature, remember to promptly refrigerate perishable groceries.

- • Never thaw food on the counter. Thaw in the refrigerator, under cold running water, or in the microwave. (Plan to cook right away, should you thaw in the microwave.)
Cool It!

HANDLE LEFTOVERS SAFELY.

- Perishable foods that have been served to children and not eaten should be thrown away.
- Why? Because bacteria multiplies rapidly in food left at room temperature. Food that has been prepared, but not served, should be refrigerated immediately. Serve within 24 hours or throw away.
FIELDTRIP FOOD SAFETY

• Bacteria can quickly multiply to dangerous levels when foods, like sandwiches, are left at room temperature.

   Keep foods safe by:
   • Keeping sandwiches in an insulated lunch bag with a frozen gel pack OR with a frozen juice box
   • Freezing sandwiches overnight. They’ll thaw by lunchtime, but stay cold and safe.
   • Packing sandwiches in a cooler with ice or cold source

Keep Cold

Some foods that need to stay cold include:
• Meat and poultry sandwiches or salads
• Tuna and egg salads
• Milk, cheese or yogurt
• Opened cans of fruit or pudding
• Peeled or cut fruits and vegetables

Room Temp Safe

Some foods that don’t need to be kept cold include:
• Peanut butter sandwiches
• Cookies
• Crackers
• Commercially dried fruit
• Unopened cans of fruit or pudding
• Unopened juice boxes
• Fruit-filled pastries

A SPECIAL ALERT:
Unpasteurized milk is not safe for children. It can be a source of E. coli O157:H7, as well as other potentially harmful bacteria. If your children are on a field trip to a dairy, NEVER let them sample raw, unpasteurized milk.
